SUMMARY

AI Engineer and Full Stack Developer at Rappi building agentic tools in production: an MCP server that gives AI agents direct access to internal microservices documentation, and AI-powered internal apps. Background in data architecture and a Systems Engineering degree. Open to remote roles with full overlap with US working hours.

EXPERIENCE

- Full Stack Developer (AI) · Rappi

2025 - Present

 - Built **DevEx-MCP**, a Model Context Protocol server (Python, FastMCP) that lets AI agents (Claude, GitHub Copilot, Cursor) search Rappi's microservices catalog and pull READMEs and OpenAPI specs on their own.
 - Shipped its local client and one-command installer for macOS and Windows: stdio-to-HTTP bridge, keyring-based auth with token refresh and forced auto-update; deployed on Kubernetes (dev/prod) behind Traefik.
 - Reached 100% unit test coverage (25 tests, pytest) with SonarQube quality gates.
 - Build internal web apps powered by AI agents for documentation and technical support automation, across backend and frontend.
 - Optimize CI/CD pipelines for AWS microservices.
- Data Architect · DBlandIT

2021 - 2024

 - Designed and managed the company's data architecture.
 - Performed data analysis, cleaning and log monitoring, and wrote scripts to automate and optimize information flows.
- Research Fellow · National Technological University (UTN FRBA)

2020 - 2021

 - Built a Google Workspace-based platform with the Chemistry teaching team to administer exams and store responses during the pandemic.

PROJECTS

- Skynet: AI assistant on Telegram (n8n, Groq LLM + Whisper, PostgreSQL, Docker, Tailscale) · GitHub

Tool-calling agent that understands text and voice notes and manages a task list with Postgres memory. Self-hosted 24/7 on a recycled PC with no open ports, automated backups, self-healing network and Telegram alerts, at zero cost.
- Improvisador (React, TypeScript, Vite) · improvisador.lat

Public speaking practice web app built for my social media audience. 1,000+ monthly users.
- OfferHub (Kotlin, Python, Selenium, Firebase)

Android app that aggregates bank promotions via web scraping. Paper presented at the CONAISI 2023 national engineering congress.
- Korean Character Recognition (Python, TensorFlow, OpenCV, NumPy) · GitHub

Convolutional neural network (TensorFlow/Keras) that classifies character images as Korean (Hangul) or Latin. Built the dataset from two Kaggle sources with a grayscale, 250x250 preprocessing pipeline.

SKILLS

- AI: AI Agents, LLM integration, MCP, tool calling, prompt engineering, n8n workflows, Whisper
- Languages: Python, TypeScript, JavaScript, Java, Kotlin, SQL
- Frameworks: React, Node.js, FastMCP
- Cloud & DevOps: AWS, Docker, Kubernetes, CI/CD, Git, Bash
- Databases: PostgreSQL, MySQL, MongoDB
- Languages: Spanish (native), Italian (native), English (B2, LSI Berkeley)

EDUCATION

- Information Systems Engineering degree · National Technological University (UTN FRBA), Buenos Aires
- 2019 - 2024

CERTIFICATIONS

- LLMs, Workflows & MCP · Anthropic
- 2026
- Prompt Engineering for Developers · Udemy
- 2025
- MongoDB Basics & Cluster Administration · MongoDB University
- 2022
